Impact of Coronavirus (COVID-19) Pandemic on Personal Relationship of Human Being

Dr. Abhishek Kumar Dubey
Assistant Professor (Psychology), Dept. of Arts & Humanities, Shri Rawatpura Sarkar University, Raipur (CG)

Abstract
The present-day outbreak of coronavirus (COVID-19) has engulfed the whole world. At the time of writing this research paper, this infection of COVID-19 is prevalent in the world of 42 lakhs. Its number in India is around 82 thousand. This virus has shown its impact in almost every area of the world, from trade to close relationships; the effect of infection of this COVID-19 can be seen and felt. The research paper presented has explained the effect of this COVID-19 infection on the person's interpersonal relationships or personal relationships. The interview method has been used for data collection and detailed explanation of the answers to each of the questions related to it. As a result, it was seen that the situation is not like as previous that a person can maintain their relationship as before, but due to the infection of this COVID-19, people are trying to maintain relationships by keeping distance from their own.

Key words:- COVID-19 infection & Personal Relationship

Introduction: At present, almost the whole world is feeling a danger due to coronavirus infection, which has not yet been found to be resolved and also not easy to guess. In this hour of crisis, it is very difficult to say how long time this virus is going to be established in the world because of the spreadibility of infection in too high (WHO). No one can guess that how many days this situation established like this. The infection of virus has generated unsolvable problems in the world, which have not been solved yet. Nearly all sectors, including world class business, academia, have stopped the pace of their work due to virus infection (Carlsson, 2020). It is the effect of the virus that today business and other working platform are changing their work style. If actually seen, the damage done by the virus infection on human physiology as well as human Psychology. The mental effect of this virus cannot be ignored (Shigemura, 2020). The effect of virus infection can also be seen on a person's mutual relationships. There was a time when the residents of small areas wishes to go for
work in big cities and think that when they will go to cities like Delhi, Mumbai etc. Many people were always lost in the daydream of foreign trips. But today the time has come for such a crisis that people are keeping distance with those migrating from big cities, some people are not even allowing them to enter their area. Dealing with our own loved ones, which was never imagined in a country like India where the spirit of Vasudhaiva Kutumbakam always exists. Even if the migrants from outside areas reach their homes in secret, on receiving the news, the nearby people are handing over them to the administration as like they have committed a heinous crime. Hiding in the house does not come under the category of crime and the people around it should also understand that we should treat all like human beings, but due to the outbreak of virus infection, today we can see the lack of humanity and experience. It has also been seen many times that a person who has been completely healthy with corona infection is also being socially excluded and in doing so a type of mental disorder is occurring in him (Kirton, 2020). Through the research paper presented, an attempt has been made to explain what effect the virus infection has on the person's mutual relations and how the effort can be made to save the relationship, all these topics will be discussed in detail.

**Objectives of the study:** - The objective of the study presented is the effect on the interpersonal relationships of the person due to corona infection. Has the sense of humanity reduced due to corona virus infection? How can the crisis of relationships arising due to corona infection be overcome? This study was started with these objectives.

**Research Methodology:** - To fulfill the objectives of the research study presented, the interview method has been used, under which some questions related to corona virus infection were created for the data collection and the questions through which it can be known that whether corona virus infection is affecting individuals' interpersonal relationships or not. For the interview, 100 participants were selected randomly from among those residing in different places. These 100 participants belonged entirely to the middle class family. In view of the corona infection, all these participants were telephonically interviewed to comply with government regulations. There was an option of yes and no for all the questions asked from one to one, made up of corona infection one by one, and the respondents were also allowed to answer in their own way as they wished. The respondents were assured that any reply you give will be kept completely confidential. This is how data was collected.
answers to each of the questions will be explained through the pie diagram and the data will be shown.

**Result:** The first question related to corona infection as a result, **would you like to trust a person in this phase of coronavirus infection?** The answers were sought from the people and it was seen in the result that most of the answers to this question People used to say that in this phase of transition, they cannot trust on any person like his own known or unknown.

![Pie chart showing Yes and No responses]

Similarly, the other interview question is that **if someone asked you for help in this phase of Coronavirus transition, would you like to help him.** Regarding this answer, discussion continues with the individuals and as a result it was seen that more than half of the people answered that they would like to help them. Most of those who did not like to help them were the people who concerned about their safety and those who lived alone in their family.

![Pie chart showing Yes and No responses]

Similarly, the third question of interview is that, **in this situation of corona infection, would you like to visit to yours relatives home.** Regarding its answers, proper discussion were made with the individuals and in the result it was seen that more than half of the people gave the same answer for this, that during the transition phase they would not like to go to anyone’s house unless it was very necessary.

![Pie chart showing Yes and No responses]
Now it was the turn of the fourth question of the interview which was such that **if a member of your family comes to your house in period of corona infection, will you give him place in the house.** In response to this question, all the respondents were unanimous and everyone gave the same answer that when it comes to the people of their family, they will definitely give them a place in their house and also replied that they should stay out of the house for some time as per the government order.

![Pie chart]

Similarly, the fifth interview question which was such that **during the corona transition period, if one of your relatives come from some place where the infection is in its acute state, will you allow them to enter your house.** When the respondents answered this question, the results were very surprising. More than half of them gave the answer that if the matter is related to their relatives, then what can they do, they also answered that they did not allowing them to come in immediately but quarantine them for some days in such a place where the government has made proper arrangements.

![Pie chart]

Now the sixth question of the interview was asked which was as **in the corona transition period if any outsider is coming from such a place where corona infection is in its high stage and it tries to come to your area because he is a resident of here, will you allow him to come to your area?** In response to this question, about 90 respondents unanimously said that they will not let them live in their area until they are fully convinced that the people coming from outside are perfect healthy and after their arrival in the area there is no danger of infection to any citizen of the particular area.
In the seventh question of interview, it is asked that **would you like to meet someone who is completely healthy after COVID-19 infection in your neighbourhood.** In the context of this answer, all the respondents did not appear to be unanimous; more than 50 percent of the people answered here that they will take their report through other methods and not meet together. But some of the respondents also said that they would definitely go to meet them and hear their experience.

In the eighth question of interview, it was asked that **if any person in your knowledge gets infected with corona infection, would you like to meet with his/her family to give them concern.** In response to this, more than 70 percent of the people replied that their sympathy is definitely with their family members in such a situation, but it is not possible to meet personally in these tuff situations.

**Discussion:** - In the discussion of the results obtained, it can be said that during the period of COVID-19 infection, a kind of fear prevails in people. It can be seen that the corona virus is definitely affecting the mutual relations of the people. At this time, the person is only able to help his loved ones. But it is not that he/she doesn’t want to help another. In a country like India, where the spirit of Vasudhaiva Kutumbakam has always existed, people are always ready to help each other even in the hour of crisis, and they are also concerned about their safety. It was also seen in the interview that the fear prevailing among people is the cause of
damage on their relationships. Fear is also necessary because at this time many families are living in such a way that their other family members are not with them, in this situation they have to protect themselves (Rehm & Shield, 2019). It is not that the person is not meeting anyone or doing any other work. Even today people are taking news of their loved ones through the phone and other type of media. They are also helping to needy person in their neighbourhood, all this work is being done just by following physical distancing and there is nothing wrong in this. Yes, one thing has come to the fore that it is natural for the people of the residential areas are angry to see the people migrating from the outer areas, because here too, their sense of security is forcing them to do so. Because an infected person with COVID-19 can spread infection to another person. That is why they are sometimes being treated inhumanely. In such a situation, the person coming from outside also has the responsibility to free the other people from the fear that he has some kind of infection and that he should enter his area by following the government instructions. It is also the responsibility of the family members of people who come from outside, to keep those members in government care unit for some day or to quarantine them in a place where no moving here & there (Badkhen, 2012). There is another thing that the people of residential areas should also take care that they do not treat strangers from outsiders because by doing so a mental disorder can also be arise in that particular person, so it is necessary to convince them with love and belongingness that it is not appropriate for them and their other family members to be with everyone at this time. Through this research paper, it is also being suggested that please care of the particular person, who have come to their homes after getting cured of this infection and those who are still infected, also asked their condition time to time (Robertson et. al., 2004). Stay doing this will not cause any kind of mental depression. By doing this, everyone can be freed from the danger of physical infection and mental illness (WHO) of this virus and the imagination of a healthy society will be realized. This is very important at this time.

**Conclusion:** In conclusion, it can be said that coronavirus (COVID-19) infection is having an effect on personal relationships. Now it depends on the person how to keep healthy relationship in such a situation. It depends on the language tone and behaviour of the person how to behave in such a situation that even after the corona infection, the person should have his relations as before. Because it is very difficult to say how many days such a situation is going to happen. Therefore, restraint will have to be maintained, so that the mental effects of this virus can be stopped.
